

MHE/NEED

26th October, 1961.

Dr. Bruce Holloway,  
Bacteriology Department,  
University of Melbourne,  
MELBOURNE, VIC.

Dear Dr. Holloway,

An experiment here involves twining vines. The plant chosen for study is a type of pole bean. In order to test possible genetic changes we wish to have small samples of the seed radiated with respectively 5000, 10,000, 15,000 and 20,000 Roentgen. Dr. Jackson of the University here, has suggested that you could make the necessary arrangements with the Westminster Carpet Company.

Please advise what formalities are desired and any charges involved. Upon receipt of this information we will send a small can containing the four packets of seed. Your assistance will be much appreciated.

Yours faithfully,

M.H. Bennett  
Clerical Officer.
