

Alan,

This is my best guess at the current status of VCA adenations of 3CRR. There are ~22 issues which I believe have not been looked at, including some quite juicy ones. The encouraging thing is how much has been done reasonably well. Suggested participation:

Brodie (editor + chief hawk) ✓

Loring ✓

Wandell

Bruno ✓ or

Pesley

Owen ✓ or

Kellerman/Ehrs ✓ or

Other people have few enough issues that they may not mind them being nipped off. There are some necessary adenations (eg 3C78.1) to a number of issues which should be looked at with a compact array. I've ignored the Kellerman + Ehrs project so far, because I haven't seen any of the results. There should be little overlap with my stuff.

R.

KAI's test guess as of March 1981. From memory - not guaranteed. Should be checked against BGC's list.

n/o	not observed.

This is the 3CRR quasar sample. As you can see, there are ~10 derivations to do at each of 2 + 6 c, less any already done by Waddell et al. I would have thought that this would not be too difficult.

### Total 43

$C \Rightarrow \geq 1/2$  fm density for a compact core.

~~Ex~~

Non-C

29

10 clear jets

3 punty jets

C

14

3 clear jets

2 punty jets

If one restricts oneself to sources which are reasonably located at Cen, A array, the % with jets goes up.

Perhaps 3C309.1 should be moved to "non-C". I don't know.  
Consider "non-C" only?

Requirements

(1) Cen, A array, ~1 hr.

3C68.1

175

181

215

245

263 < 309.1?

336

Data for 367 Jets and Possible Jets

11:56:44 am

June 18, 1991

This list is maintained by:

Alan H. Bridle, NRAO

Charlottesville, Virginia 22903-2475, U.S.A.

Please feel free to use it for any research purpose. Acknowledgement of its contribution to any publication that makes extensive use of it will however be appreciated, as many man-hours have gone into compiling it.

Jets:

111 jets in above list, status: Poss

**From abridle Tue Mar 31 18:57:36 1992**

**From: abridle (Alan Bridle)**

**To: WARDLE1@BINAH.CC.BRANDEIS.EDU**

**Subject: jets/counterjets/sizes**

**Date: Tue, 31 Mar 92 18:57:15 -0500**

Here's the basic data for all the sources that could go into those figures, with cjet info where I have it. If you'd like derived data (prominence ratios, powers, etc.) as in the figures I'll send that too, but this is the stuff from which the rest can be obtained.

I have done modeling of the expected jet boosting-normalized-by-length plots that would simulate Figure 1 for various sorts of orientation distributions. Mostly just to check that you could get the slope of the "upper branch" in that plot quite plausibly from the usual models. However, I don't think this is likely to be the whole story (making the upper branch by boosting the lower one) if any of the strong-source counterjets are truly real and not just confusing lobe filaments, etc. The counterjet candidates are just too strong for that!

As for the size selection, given that my list is only sources for which jets have been detected, it may be a bit biased against large radio galaxies in the "standard model". I haven't been saying anything (I think) that depends on the size distribution itself being fully representative, I've just been looking at the trends in what may be upper limits in the prominence-size domain.

The bottom line for me is still the one I point to in the review: it all fits together quite nicely if you take the standpoint of the "unified models", but there are other ways to do the same things if you're allowed some intrinsic one-sidedness. What it needs is for the "intrinsically one-sided" approach to come up with a plausible explanation for the depolarization asymmetry! I'm somewhat surprised that this has not happened yet (I thought there were enough theorists ready to jump into any vacant niche to have done so by now!).

Anyway, here's the basic data:

===== clip here

Flux Density-Size Data for 155 Jets            6:20:28 pm            March 31, 1992

This list is maintained by:
