Holcomb, New York  
U. S. A.

Greetings Bruce:

The project here is radio astronomy at hectometer waves. Considerable listening tests are made. Near the equinoxes signals often roll in from north america during the early evening hours. The path eastward is darkness to dawn in U.S.A. WNU, 2048kc, Slidell, La. and WCC, 2036kc, Chatham, Mass. are frequently heard.

Present transmission conditions should have been duplicated during the early to middle 1920s. Do any of the old timers have log books showing heard signals over this path at similar frequencies during those years?

Best regards,

  
Grote Reber
