

23rd October, 1964.

Mr. David Lesh,  
Cassel,  
California,  
U.S.A.

Dear Mr. Lesh,

Recently our Mr. K. L. Taylor has returned from a long trip. He gave me a note which indicated your interest in vines. Enclosed is a reprint entitled Reversed Bean Vines. A more sophisticated article will appear in the next issue of the Journal of Genetics.

As you probably are aware, some species of vines turn clockwise (hey) while other species turn counter clockwise (bean). The direction of twine is the same for all individual plants of a given species both in northern and southern hemispheres. Would you like to try some experiments?

Yours faithfully,

Greta Baker.
