January 24, 1961.

Dr. Grote Reber  
P. O. Box 2  
Greenbank  
West Virginia.

Dear Dr. Reber:

Your article in CASTANEA for December, 1960, relative to the twining of vines in the Northern and Southern Hemispheres has been called to my attention by my good friend of several years' standing, Dr. Edgar T. Wherry.

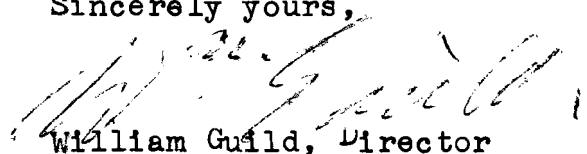

I am not able to secure a copy of the afore-mentioned publication locally, but I am writing for it.

In the meanwhile, Dr. Wherry briefly gave me your results and suggested that I write you.

This has been an experiment which I have long wanted to conduct, and I venture to trespass on your good nature to ask if there are any variations on your methods which we might try, including the use of vines other than beans.

Our plan is to set up a correspondent in South America, and possibly Tasmania, to discover if vines which twine clockwise or counter clockwise would reverse themselves after being transported across the Equator.

Sincerely yours,

William Guild, Director
