Saw Gordon of Cornell at URSI.  
He said that solar energy was only  
about 5% in voltage above internal sit  
noise on their equipment at 200mc. They  
use a superhet receiver with one R.F.  
stage and a 30mc I.F. Operating frequency  
is 200mc. The antenna is two receiver  
antennas from a SCR 268 connected together  
and mounted alti-azimuth.
