Radio Signals From the Stars?

NIGHT after night a man named Grote Reber keeps his eye on a lot of little gadgets hooked up to a 31-foot mirror in Wheaton, Illinois. The oversize looking glass isn't there to reflect the light of the moon and the stars and no one calls Mr. Reber a mad scientist when he talks about collecting "cosmic static"—because that's what he's picking up in the big reflector.

The high-frequency waves that are gathered in the giant mirror are of great interest to radio engineers—and it is possible that they are signals from beings living on planets thousands of light-years distant from the earth.

The story of the waves and the contraption that picks them up is plainly and excitingly presented in next week's issue of The American Weekly.
