

23/12/64

Attenuation of Delay Lines

Line A

Line Frequency MC	ADYU, 1μs, 600Ω				G.R. 22/12/64, 0.35μs 1500Ω			
	Source	Input	Output	Loss	Source	Input	Output	Loss
.005	1.76	1.00	.89	1.01	1.82	1.00	1.00	0
.01	1.82		.89	1.01	1.86		1.00	0
.02	1.90		.89	1.01	1.98		1.00	0
.05	1.86		.89	1.01	2.00		.99	.08
.1	1.82		.88	1.10	1.98		.99	.08
.2	1.92		.88	1.10	2.00		.98	.18
.5	1.90		.84	1.52	2.02		.98	.18
1.0	1.98		.82	1.72	1.90		.92	.72
2	2.08		.77	2.26	2.22		1.15	-1.22
5	1.88		.48	6.38	2.80		1.41	-3.00
10	2.04		.32	9.90	1.92		.69	3.22
20	1.86		.11	19.16	2.44		.51	5.84
50	1.80		.02	34	4.10		.12	18.41

Voltmeter has 1 pF capacity. This is 1600 ohms at 10μs

Probably 1700 ohms would be optimum for G.R. 22/12/64

Continuously Variable Delay line type 509
ADYU Electronics Lab., Inc., Passaic, New Jersey

See AD-YU data sheet for Line A with $1000\ \Omega$ termination

ADYU Type 509 is line about $\frac{1}{4}$ " dia, 16" long formed into a circle $5\frac{1}{4}$ " dia. It is tight wound enamel wire about 0.007" dia over a slit copper covering on form. Length of line = 64 times diameter = 0.41 meter = 1 microsecond.

$$\text{Velocity} = 0.41/300 = .0014 \text{ C} = C/700 \text{ which is very low,}$$

$$= \frac{41}{10^{-8}} = .41 \cdot 10^8 \text{ cm/sec, } Z = 600\ \Omega$$
