To meet the demand of terahertz devices, we develop a new type scandium aluminate impregnant. Scandium aluminate was synthesized via solid phase mixing and sintered in air atmosphere. Powder X-ray diffraction (XRD) measurement and Rietveld refinement revealed that scandium aluminate impregnants is Ba$_3$CaAl$_4$O$_{12}$Phase with Ba$_2$ScAlO$_5$ secondary phase. The Current-Voltage characteristics of this impregnated scandate cathode was measured in the DC mode and the maximum current density is 17.6 A/cm$^2$ occurring at 1100ºC for the applied voltage from 0 to 540 V. It illustrates that the scandate aluminate impregnant is promising for applications in THZ electronic devices.
